

**AMENDED CLAIM SET:**

1. (currently amended) A dispensing cap for bottles, said cap comprising

a lower mounting part fixed onto neck of bottle, said lower mounting part comprising a cylindrical shell tightly seating on the neck of bottle, said cylindrical shell having an inwardly directed fixing flange on its lower end which, after mounting, joins permanently to the bottle under an outside flange of the neck of bottle,

an upper covering part containing the dispensing parts including valve and opening elements,

sealing elements between the cap and the bottle for gas-proof sealing,

an outlet for pouring liquid,

a tube support for holding the tube of siphon structure, and

an irreversibly removable fixing member preventing dispensing,

wherein the lower mounting part is provided with an upwardly directed collar on its border, said collar seating in a groove formed by a cover wall of the upper covering part and a downwardly directed inner wall of the upper covering part extending in parallel to said cover wall,

wherein said outlet comprises an outlet base belonging to the lower mounting part provided with an upward directed collar on its border seating in the groove formed by the cover wall and the parallel downward directed inner wall and an outlet cover belonging to the upper covering part cover, and

wherein the opening elements comprise a valve case belonging to the lower mounting part, and a valve belonging to the upper covering part cover, wherein the upper covering part cover is provided with a holding tube surrounding the valve, but not reaching the top edge, but does not reach the upper level of the valve case, and

wherein the fixing member is arranged in the outlet and having an once breakable comprises a once-breakable joint to the upper outer end of the outlet cover, said fixing member extending passing under the holding tube[[,]] and being supported by the valve case, and its free end being fork-shaped to partly surround the valve and its end surrounds the valve, and

wherein the mounting part, the cover, and the fixing member are joined together and assembled into a dispensing cap by using dowel holes formed in the mounting part and dowel pins entering the dowel holes that are formed in the cover to join permanently together the lower and upper parts of the dispensing cap.

2. & 3. (cancelled).

4. (currently amended) The dispensing cap according to Claim 1, wherein the lower mounting part is provided with further comprises

an inwardly directed flange elastically bearing from outside the bottle against seating from outside to the neck of the bottle, and

a sealing stub entering extending into the mouth of the bottle and elastically bearing seating from inside the bottle against the neck of the bottle to it.

5. (cancelled).

6. (currently amended) The dispensing cap according to Claim 1, wherein a diaphragm is formed in the upper covering part shaped by reducing the thickness of the top of the upper covering part above eever around the valve, said diaphragm being partly or wholly surrounded by and complemented with a projection of the upper covering part surrounding it partly or wholly.

7. (currently amended) The dispensing cap according to Claim 1, wherein the lower mounting part, the upper covering part eever, and the fixing member are connected in the process of manufacturing to constitute a single piece.

8. – 10. (cancelled).

11. (cancelled).
